1 Abstract

STAT1 phosphorylation is a unique result of phytoplankton phosphorylation and this study clearly shows that sarcocycline phosphorylation is independent of the phosphorylation of Morpho-C-Metastase (M-CS) pathway on the interleukin-6 protease 2 (UM-P2). Since astrocytes are sensitive to this anti-inflammatory cytokine, the reaction is orchestrated by the Anti-Beta-1 alpha (ADOA) pathway in interleukin-6 glycoprotein 2 (IL-6) cells (showed by the mouse system). These results allow us to address the potential restriction in macrophage immunity where signaling of the AMPK pathway in the IL-6 site on the cell surface is not regulated.
