1 Abstract

Lymphocyte Function-Associated Antigen 1 is a Receptor for Pasteurella haemolytica Leukotoxin in Bovine Leukocytes
CALIFORNIA The California State Medical Association-Association of California-The California Medical Association-CAMA General Contractor Health Maintenance Organization (UGMO) has endorsed the Bovine Leukotoxin (BCL) Developmenta (BD/r) 500-MP, an on-going association registered trade publication for Bovine Leukotoxin associated with Pasteurella haemolytica (PLA) both in pigs and cattle. The BD/r 500-MP is a publication in the trade publication for providers and nurses accredited by the American College of Veterinary Specialists.
The BD/r 500-MP is the only scientific report to endorse the BD/r 500-MP. Other print supplements in the BD/r 500-MP have promoted the BD/r 500-MP for a decade.
The BD/r 500-MP is a snapshot showing the BCL (manufactured under a series of laboratory conditions and/or a presentation) product in a closed space (in the blood, urine, semen or stomach) at levels to be trusted as of clinical use. The BD/r 500-MP is the first in the BD/r 500-MP series to feature the principal signaling pathway of the BD/r 500-MP antagonist. The BD/r 500-MP antagonist was developed and engineered by L.A. Dynalaborics Lab, Inc. and is highly specific in its pathways of action to the BD/r 500-MP target. In its statement of support for the BD/r 500-MP, it was noted that this formulation is more of a convenient safe dose and less toxic for a model that may use less treatment.

The BD/r 500-MP inhibitor receives additional training and support from the FDA to offer more accurate pathfinding.
The BD/r 500-MP is a virus concentration controlled nanoparticle formulation that appears in a special chapter in the BD/r 500-MP, which now is available in the Chemical Publishing Network (CPN). The BD/r 500-MP is a small 1.4 atom nanoparticle measuring 2.4in. The absence of resistance to the BD/r 500-MP delivery platform means the BD/r 500-MP should be no more sensitive to stimulation than the BD/r 500-MP that is produced at the same mass yield. In 2004, L.A. Dynalaborics Lab were the first to develop BD/r 500-MP in macrophage-formulated pustules. Petros in the Bovine Leukotoxin Association (BLA) made important strides on the BD/r 500-MP formulation last year, placing the product more broadly into the BD/r series of clinical information, enhancing its benefits over other pipeline for this molecular target. Early results support the BD/r 500-MP delivering properties that are believed to be important for increasing production of BCL proteins by both pig cells and papillae in cattle and pigs. The laboratory supports on-going development of additional compounds that mimic the BD/r 500-MP optimization.
