## 1 Abstract

IRVINE, Calif. (KGTV) - DNA can be a doorway to many diseases.  
One of the leading causes of cancer is not so linear, causing blossom blindness  
in premature infants.  
Glioma cells are white blood cells.  
But the exact function of these cells is still undetermined.  
The new treatment is a molecular change that improves progression from glioma  
to kidney tumors.  
Physician Henry Cheer of the Karen Foundation says she experienced high mo-  
tivation to use her traditional pathologist's skills to use a molecular marker the  
way Iliad Therapeutics hopes to use my gene.  
The Michelson Institute plays a major role in this treatment which is still under  
development but has potential to improve a type of relapse caused by glioma.  
He says they are extremely excited about my gene selection and the potential  
of this drug.
