1 Abstract

This 1 mg tablet of ALZ-18386 is a designated analgesic receptor for fibrogenic signaling pathways in pericytes and myofibroblasts that are inhibited by DKK-1. ALZ-18386 blocks Alzoning3 and NS766 signals that trigger mood regulation. This dosing represents a novel approach that may lead to improvement in therapeutic outcomes for fibrogenic signaling pathways.

The power of ALZ-18386s ability to block ALZ-18386 in pleural fibroblast cells, fibrogenic tissue layers, and the cardiac sub-system is at high levels. This ability and specificity may prove useful for development of novel drug delivery strategies and methods for delivery of therapeutics to fibrogenic tissue layers, with a primary objective of blocking select endogenous delivery sites.

This Drug is the only, existing and approved drug for the treatment of ulcerative colitis. It has demonstrated broad action against the heart, blood vessels, and the peripheral nervous system.

For more information, please visit www.Alzochemicals.com or call (858) 667-6002, extension 1460.

The ALZ-18386 compound is now available by prescription from Alzochemicals, Inc. for the treatment of ulcerative colitis. A number of medications have demonstrated positive outcomes against the disease in patients who received ALZ-18386 treatment. For more information, please visit www.alzochemicals.com or call (888) 667-6002, extension 1460.
