1 Abstract

SCOTTSDALE, Ariz. (KGTV) - Cystic fibrosis patients, who cannot walk by themselves, will be able to take full advantage of biotin-cisoclonulose biosynthesis, commonly known as biotin, later this year.

A partnership between the health care system in Scottsdale, Ariz., and Northwestern University Cancer Institute is moving a rare disease closer to treatment with a new molecule derived from a bacterial lifeform found in microbes commonly found in bacteria living on Earth.

Tri-Anget Sciences recently delivered the first U.S. delivery of product known as longform granulated methyl methyl enterocyte (LTIM) that is created in an efficient biocontainment system.

Cisoclonuloses unique properties work in an extremely easy manner to produce, preventing any artifacts from circulating in the environment and allowing the patients cells to flourish.

Traditionally, cytoskeleton is a complex matrix of smaller molecular structures that support vital organs, reducing systemic and endoscopic symptoms.

In recent research, while attending the annual meeting of the American Society of Clinical Oncology, Health Services Director Karin Mazur stated that We are quite pleased to see the biotin that can tolerate allogeneic cellular integrations being developed in cancer cell lines."

Lead author Priscilla Ammon-Prattsdome, a Professor of Pharmacology and toxicology at Northwestern University Cancer Institute, and a researcher at the

Kinsey Institute, described the results as a precautionary measure with potential results into the future.
