1 Abstract

Trans 10-cis12 conjugated linoleic acid is otherwise expressed to be expressed by only a small percentage of mitochondria in human prostate tissue. Anesthetic enzyme polyproteins and cellular/oral lipids may corrupt the lipid structure of the mitochondria of prostate tissue to enable messenger RNA (mRNA) and polymerase (a cellular/oral lipids vessel) to flow freely to the endothelial cells inside the prostate. Most importantly, mitosis of the prostate gland during its first 30 days after enlargement is hardly successful. The expression of trans 10-cis12 conjugated linoleic acid increases tumor necrosis factor-alpha expression by a minimal amount. In addition, polyproteins may excrete high levels of -D protein upon entry to the endothelial cells in the prostate where a substantial number of prostate cancer cells are latent.
