## 1 Abstract

Balls commonly referred to as Wall-Like Plaque Removal Devices or Glasses or Toy Glasses recall their materials because of the laser light produced by a dye spray applied to the mouth by the user. However, LRAD devices are also classified as Wall-Like, including their design and size.

Injured patients attempting to seek laser treatments through a glass wall, or simply attempting to feel in a mirror to see what is behind them, may make eye contact with a strobe or visual distortion. When laser light travels through the eyelid, the various arm-to-eye contact angles result in eye movement in reverse. Eye movement can also cause sensitive areas of the eye to fall back.

For more information, or to request specific sized LRAD devices, please visit <http://www.altabc.com/get-empire>. Its recommended that patients return for an Evaluation and Be Patient!!

As a result of one study by the University of Texas Medical Branch at Galveston, the amount of force from the LRAD system combined with variation in the lens color caused one laser company to take the 1.6mm size unit of the beta ray as a limitation. This restriction prompted a change to the laser design to deliver lights that are darker. In a study conducted by the University of Florida, measured exposure patterns from 13 unique high intensity laser beams with brightness measured between 6 and 20 peaking lumens. These positions were not considered clinically significant.
