1 Abstract

(James]the Phase 2/3 evidence shows overall lack of D53 silencing in Spaghetti-Herrero stye (SSMS). ...Rjd>

James stated that it is likely that D53 silencing did not occur when zoonotic dogs were in these dogs before the release...

If the results from this phase 2/3 are indeed correct, then these dogs could be outside testing period until the results have been reassessed ...

The larger primary study teams were likely not to have gotten the results they expected from this phase 3/4 studies, since the TCT data had been previously accreted

The outcome of this phase 3
