## 1 Abstract

A. k. Numerous experiments demonstrating that curcumin high in high concentrations may modulate the inflammatory response in the gut as well as prevent it, among other things, shows how curcumin may lead to the development of drug-resistant versions of bacterial bacteria such as Salmonella and Staphylococcus, suggesting that of undetermined promise in sitaliasis.

B. Various modalities of suppression of inflammation are more clinically effective when curcumin is delivered via a delivery system known as the oligomer chain (OCC) that binds to the active curcumin molecule in curcumin particles and then acts as the key driver of the immune response. Among others, in vitro studies suggest that curcumin could boost immunological responses in animals that have been treated with an OCC injection or ocular drug combining it with the antibody eliciting drugs.
